

# Embedded Linux system development

## 5-day session

<b>Title</b>	Embedded Linux system development
<b>Overview</b>	Introduction to Embedded Linux Cross-Compiling Toolchains Bootloaders Linux Kernel Introduction Linux Root Filesystems Embedded Linux System Development Embedded Linux Application Development Real Time in Embedded Linux Systems Practical labs with the ARM-based Beagle Bone Black.
<b>Duration</b>	<b>Five</b> days - 40 hours (8 hours per day). 50% of lectures, 50% of practical labs.
<b>Trainer</b>	Ulf Samuelsson <a href="http://www.emagii.com/">http://www.emagii.com/</a>
<b>Language</b>	Oral lectures: English, Swedish. Materials: English.
<b>Audience</b>	People developing devices using Linux People supporting embedded Linux system developers.
<b>Prerequisites</b>	<b>Solid experience in C programming</b> In particular, participants must be familiar with creating and dealing with complex data types and structures, with pointers to such symbols, as well as with function pointers. <b>Knowledge and practice of UNIX or GNU/Linux commands</b> People lacking experience on this topic should get trained by themselves with our freely available on-line slides ( <a href="http://free-electrons.com/docs/command-line/">http://free-electrons.com/docs/command-line/</a> ).

<b>Required equipment</b>	<p><b>For on-site sessions only</b> Everything is supplied by eMagii in public sessions.</p> <ul style="list-style-type: none"> <li>• Video projector</li> <li>• PC computers with at least 4 GB of RAM, and <b>Ubuntu Linux 12.04 (x64)</b> installed in a <b>free partition of at least 60 GB</b>. We don't support other distributions, because we can't test all possible package versions. <b>Using Linux in a virtual machine is not supported</b>, because of issues connecting to real hardware.</li> <li>• Labs should be run on Intel Core i5 or better.</li> <li>• <b>Connection to the Internet</b> (direct or through the company proxy).</li> <li>• <b>PC computers with valuable data must be backed up</b> before being used in our sessions. Some people have already made mistakes during our sessions and damaged work data.</li> <li>• It is a good idea to do a fresh install on a new disk which subsequently can be used as an external USB disk.</li> </ul>
<b>Materials</b>	<p>Print and electronic copies of presentations and labs. Electronic copy of lab files.</p>
<b>Credits</b>	<p>This material is developed by Free-Electrons and eMagii.</p>

## Hardware

The hardware platform used for the practical labs of this training session is the **BeagleBone Black**, which features:

- An ARM AM335x processor from Texas Instruments (Cortex-A8 based), 3D acceleration, etc.
- 512 MB of RAM
- 2 GB of on-board eMMC storage
- USB host and device
- HDMI output
- 2 x 46 pins headers, to access UARTs, SPI busses, I2C busses and more.

## Labs

The practical labs of this training session use the following hardware peripherals to illustrate the development of Linux device drivers:

- A high-speed micro-SD card (minimum 4 GB)
- A SD-Card Reader
- USB - Ethernet adapter. The Ethernet will be reconfigured, and if you do not want to change your normal setup, an USB - Ethernet adapter is OK.
- USB - Serial Adapter
- Two free USB ports for USB, or an external powered USB hub.

## Day 1 - Morning

---

### Lecture - Introduction to Embedded Linux

- Advantages of Linux and open source for embedded systems
- A few examples of embedded systems running linux
- Embedded Hardware for Linux systems
- Embedded Linux system architecture

### Lab - Training Setup

- Install the Lab archives

## Day 1 - Afternoon

---

### Lecture - Cross Compiling Toolchains

- Definitions and Components
- C Libraries
- Toolchain Options
- Obtaining a Toolchain

### Lab - Cross Compiling a toolchain

- Building a Yocto SDK
- Configuring Crosstool-NG
- Build a toolchain
- Getting a free commercially supported toolchain (Sourcery)

## Day 2 - Morning

---

### Lecture - Bootloaders

- Boot Sequence
- The U-Boot Bootloader

### Lab - U-Boot

*Using the BeagleBoneBlack*

- Communication with the board using a serial console
- Configure, Build and Install U-Boot
- Learn U-Boot commands
- Setup TFTP communications

## Day 2 - Afternoon

---

### Lecture - Linux kernel Introduction

- Linux Features
- Linux Versioning Schemes
- Linux Kernel Sources
- Kernel Configuration
- Compiling and Installing the Kernel for the host
- Cross-Compiling the kernel
- Using kernel modules

### Lab - Kernel cross-compiling

*Using the BeagleBoneBlack*

- Set up the cross compiling environment
- Configure the kernel using Kconfig
- Cross-compile for an ARM platform
- Boot the kernel

## Day 3 - Morning

### Lecture - Linux Root Filesystem

- Principle and solutions
- Contents
- Device Files
- Virtual File Systems
- Minimal File Systems
- Busybox

### Lab - A tiny embedded systems

- Make linux boot using NFS
- Configure and Create a minuiimalistic Linux embedded system
- Install and use Busybox
- System startup with /sbin/init
- Setup a simple web interface
- Use shared libraries

## Day 3 - Afternoon

### Lecture - Block Filesystems

- Difference vs Flash file systems
- Devices
- Traditional file systems (ext2,vfat)
- Journalled file systems (ext3,ext4)
- Filesystem recovery
- Mounting filesystems
- Squashfs
- Tmpfs

### Lab - Block Filesystems

#### *Using the BeagleBoneBlack*

- Creating partitions
- Booting with a mix of filesystems

### Lecture - Flash Filesystems

- The MTD subsystem
- MTD partitions
- JFFS2
- Yaffs
- UBI

### Lab - Block Filesystems

#### *Using the BeagleBoneBlack*

- Note: this lab needs revising, Beaglebone does not have NAND Flash
- Note: Needs to show UBI
- Creating partitions on flash storage
- Read-Only JFFS2
- Read-Write JFFS2

## Day 4 - Morning

---

### Lecture - Embedded Linux system development

- Open Source components and licensing
- Networking
- System Utilities
- Language Interpreters
- Audio, Video and Multimedia
- Graphical Toolkits
- Databases
- Web Browsers
- Examples

### Lab - Manual cross-compiling

#### *Using the BeagleBoneBlack*

- Manual cross-compiling applications and libraries
- Common techniques and issues

## Day 4 - Afternoon

---

### Lecture - Build Systems

- System Building
- Commercial Linux solutions

### Lab - Buildroot

#### *Using the BeagleBoneBlack*

- Rebuilding using Buildroot
- Adding your own DirectFB based application

## Day 5 - Morning

---

### Lecture - Embedded Linux application development

- Developing applications on embedded linux
- Integrated development environment
- Version Control Systems
- Debuggers
- Remote debugging
- Memory checkers
- System analysis
- (Not) Developing on Windows

### Lab - Application Development and debugging

#### *Using the BeagleBoneBlack*

- Compile your own application
- Set up remote debugging
- Debug a simple application

## Day 5 - Afternoon

---

### Lecture - Real-time in embedded linux systems

- PREEMPT\_RT
- Real time extensions
- Xenomai

### Lab - Real-time

#### *Using the BeagleBoneBlack*

- Check Clock accuracy
- Build a POSIX real-time application
- Build a Xenomai real-time application
- Compare the two solutions
